

What \$300,000 produces

The impact of the funds requested. The organisation, the model and the evidence behind every figure are in the materials at question 23.

What the money builds

Two community production facilities, one each in a community that has asked for one, at an allowance of \$150,000 a facility. A facility is a site base and four modules: collection and sorting, shredding, pressing with CNC and finishing, and assembly. All modules and the site base come to \$95,767 to \$142,467; the allowance sits above that so a harder pad or a longer power run does not stop a build. It takes about 3 months from money to first bed. A facility starts at 200 beds a year on one press and reaches 720 on the same equipment as the local crew builds speed.

Palm Island and Maningrida are the working choices. Neither has agreed, and neither is named to a funder as agreed before it has. Alice Springs is a third facility under Oonchiumpa's own Commonwealth offer, outside this request.

What each bed does, with the unit it is counted in

OUTCOME	UNIT	PER BED	LABEL
Paid making	hours	2	modelled
Recycled plastic kept in use	kilograms	20	modelled
Money kept in the community when it sells the bed	dollars	\$750	settled rule
A person off the floor	beds	1	counted

Health is why the hardware exists and is not a row. Scabies and rheumatic heart disease are why a bed is washable and off the ground. That is where the claim stops.

What two facilities produce in their first year of running

BOTH FACILITIES, FIRST YEAR	AMOUNT	LABEL
Beds made in community	400	modelled
Paid hours of making	800	modelled
Recycled plastic in beds	8 tonnes	modelled
Money kept in community, if every bed is sold	up to \$300,000	modelled

How many beds a community sells and how many it places is the community organisation's decision, and no community's numbers go in a document before it has seen them. The facilities do not make this year's first stock; that is made at the Goods on Country facility in Queensland.

How each row is counted

Beds are units in a live register, counted per community, and the register is the source of every count we publish (attachment 01). Every figure carries a label: verified, workpaper, modelled or target. Hours and kilograms are modelled today; the first fifty beds from each facility are timed and weighed on site, which replaces both with measured numbers (attachment 03). Voices are held in Empathy Ledger with consent per person and per quote (attachment 10).

The test at month six

1. Who holds the keys?
2. Who runs the payroll?
3. Who invoices the buyer?
4. Is at least half the production local?

We report the answers whichever way they fall. A facility that answers no to three of them is a finding, and more useful than one reported as a success.

What this grant does not pay for

Beds. Philanthropy buys the first 400, so a community's facility and its stock never compete for the same dollar, and no community sale repays QBE. It does not pay the running cost of the organisation, which the \$150,000 loan carries in the first year, and it does not pay for the work around each bed, which sits inside the \$750 price.

What happens after the two facilities

Nobody lends against a community-made bed today, because nobody knows what one costs to make in a community. These two facilities produce that number in their first year, along with the cost of running a site a long way from a city. Grant capital builds facilities one and two. A measured cost is what lets repayable capital build the next ones.
