

Goods’ cost-down path (an experience curve)

Marginal cost per bed falls as we mature in production — the same shape as solar panels and EV batteries.

THE COST-DOWN

Marginal cost = what one more bed costs to make and freight, before the ~\$109,500/yr fixed block. Owning the plastic press (Buy-Kit → Factory) is the big step down; community feedstock + fair-wage labour holds it there.

Source: Goods cost model v6 (2026-06). BOM + \$750 price verified; in-house legs, labour, freight and volumes modelled. Solid points are real/target paths; the dashed tail is illustrative — actual learning rate pending Defy volume quotes.
