

How many beds to break even

Each bed's contribution stacks up toward the \$109,500/yr fixed block. In-house production crosses it at ~335 beds; buying kits needs ~1,679.

Breakeven = $\$109,500 \div \text{contribution per bed}$, at the AU\$750 price. The flatter the line, the more beds needed — which is why in-sourcing the plastic (steeper line) is the whole capital case.

Source: Goods cost model v6 (2026-06). Contribution at \$750 price, \$150/bed freight basis. Philanthropy bridges the gap below breakeven. Modelled.
