

Why “\$1,780 a bed” is misleading

Fully-loaded cost is fixed running costs divided by how many beds we make. Make more beds and it collapses toward the real marginal cost.

Fully-loaded = marginal cost + (\$109,500 fixed block ÷ beds per year). The bed doesn’t get cheaper to make — we just stop dividing a year of fixed costs by a tiny number.

Source: Goods cost model v6 (2026-06), fully-loaded grid. Freight falls with volume (\$150→\$80/bed) as pallets fill. Modelled; volumes are targets, not commitments.
